Connecting your gateway to your Business NBN/Fibre Broadband & Voice Service

This quick start guide is designed to get you up and running quickly with your new gateway.

Power Adaptor

Phone Cable

2x Network Cable

Business Fibre Data Port

For NBN connections please refer to your NBN welcome pack

1. Connect your gateway to the internet by connecting the LAN4/WAN **1** to the NBN Data Port or the allocated labelled UNI-D on the NBN ONT using the supplied network cable **2**.
2. Connect the second network cable to your computer then to your gateway port labelled LAN1 **3**.
3. Connect your power adaptor to the gateway and your wall outlet. Ensure the gateway is switched on.
4. If you have a Business NBN/Fibre Broadband or Voice Service, delivered over the Commander Gateway, connect the telephone cable from your existing telephone or telephone system to the port labelled Phone 1 and / or Phone 2 (refer to your welcome email) **4**.

Configuring Your Gateway

After you have completed steps 1 through 4, your gateway will automatically start talking to our servers. It will retrieve your login details and other settings during this time, so please leave it connected and allow **up to 10 minutes** for your gateway to set up automatically. Your gateway may reboot during this process.

Once this process has completed, you should have a green light for **Status and Broadband** (and Phone if applicable).

Setting up your WiFi Network

Your gateway has WiFi capabilities which means you can connect wireless devices such as laptops, smartphones and tablets to the gateway in your office, so that you can access the internet through them wirelessly.

On the back of the gateway you will find your WiFi network name (WiFi SSID) and password (WiFi Password), you will need these details to connect your devices.

Using the device you would like to connect to your gateway, search for WiFi networks. Once you find your WiFi network name (or SSID) select that network. You will be prompted to enter a password or network key. Once you have entered your password you should be connected!

Your connection and WiFi network settings are unique and automatically secure, you can repeat the above steps on multiple devices that you would like to connect wirelessly.
